Unsupervised Machine Learning

→ we will be solving the clustering.

clustering → grouping the data into similar cluster.

Dataset

Age	Experience	salary

⇓

In unsupervised machine learning we only have the independent variables and with no dependent output variables,

⇓

using unsupervised ML

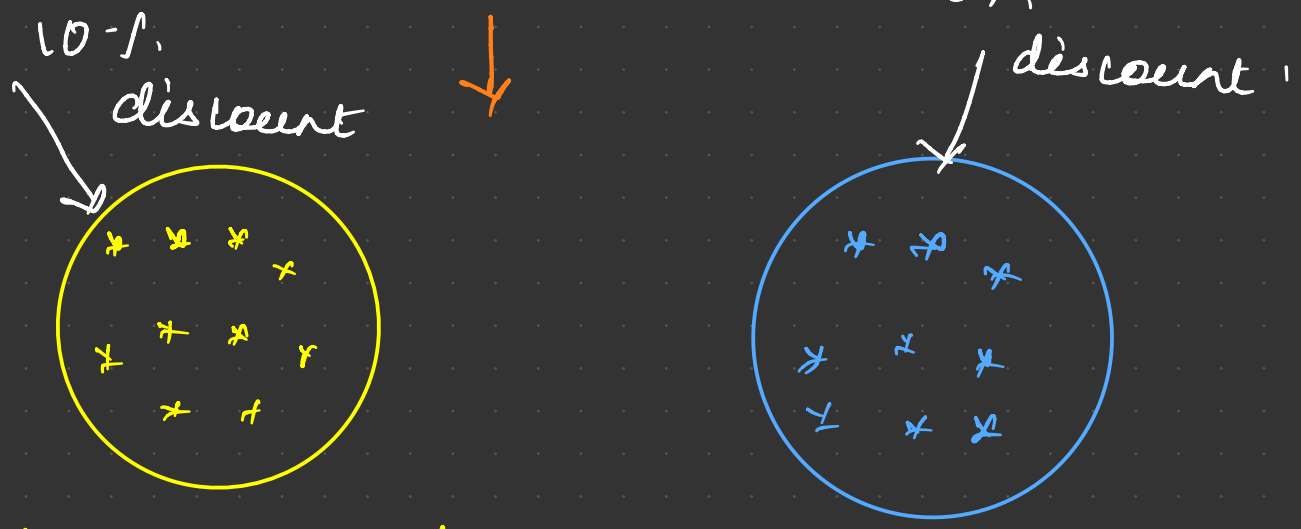
⇓

Group or cluster.

Example: customer segmentation

Product = Data Salary Spending score

→ New product ← Discount.



People buy regularly

People buys occasionally.

Various Machine Learning algorithm

1. K - Means clustering
2. Hierarical clustering
3. DBSCAN clustering
4. Silloute Scoring.
